

Your Personalized Skin & Health Profile Summary

PATIENT & FAMILY EDITION | Prepared for: Subject MM-MAMTA--A340 | Reference ID: MM-MAMTA--A340

Welcome to your personalized health report. This document explains what our AI-assisted health checks found about your skin type and genetic markers in simple, everyday language. Use this guide to understand your natural sun defenses and to have an informed, comfortable discussion with your doctor.

1. Your Detected Skin Type & Natural Protection

Detected Skin Type	Type I (Skin Tone Angle: 59.8°)
What It Means For You	Very Light Tone: Your skin has delicate natural pigment. It burns very easily in direct sunlight and rarely tans. It needs the highest level of daily sun care (SPF 50+).
Sunscreen Advice	Apply a broad-spectrum SPF 30 to 50+ sunscreen every morning. Reapply every 2 hours when outdoors.

2. What Genetic Markers Were Checked (Plain-English)

Gene / Marker Checked	What This Gene Does In Your Body	Your Result & Simple Meaning
TP53 (Cell Guardian Gene)	Acts as the body's natural defense mechanism, repairing damaged cells or removing cells that aren't working properly.	Change Detected: Your body's cell-repair signals may need extra monitoring. Discuss this with your doctor.
BRCA1 / BRCA2 (DNA Repair System)	Helps repair normal day-to-day DNA changes that happen as cells divide and renew over time.	Variant Noted: A genetic variation was observed. Your doctor can discuss if preventive health checks are helpful.
Body Inflammation (hs-CRP Marker)	Measures natural immune activity and wellness in your tissues and bloodstream.	Slightly elevated (3.8 mg/L). Staying active, eating whole foods, and managing stress can help bring this down.

3. Understanding Your Overall Health Assessment

Our combined classical and quantum AI tools calculated an overall risk rating of **85%**. This is **NOT** a medical diagnosis. Rather, it is a risk indicator — like a caution sign on a road — suggesting that you and your healthcare team should schedule regular, proactive check-ups.

4. Helpful Next Steps For You & Your Doctor

1. Schedule A Doctor Visit:	Take this report to your primary doctor or dermatologist. They can review your skin in person and confirm your genetic health profile.
2. Monthly Skin Self-Checks:	Check your skin once a month. Look for new spots, changes in existing moles (Asymmetry, irregular Borders, varying Colors, or Diameter larger than a pencil eraser).
3. Sun-Smart Habits:	Wear protective hats, sunglasses, and broad-spectrum sunscreen when in direct sun, especially between 10 AM and 4 PM.

Important Patient Notice: This summary is produced by an educational and decision-support AI platform. It does not replace clinical judgment or provide a definitive medical diagnosis. Always consult a licensed medical professional for personal healthcare decisions.
